The Most Important Thing I Learned At Conservation Field Days

Ducks And Wetlands

At conservation field days we learned about ducks and wetlands. We learned about why wetlands are important. We learned about animals that live in wetlands and what they do in the wetlands. One of the animals that was talked most about was ducks. We learned many details about ducks.

There were many types of ducks that we learned about. One fact is male ducks have bright colors to attract a mate and the females have dark colors to hide when nesting. The most common duck is the mallard duck. The pintail duck has a long neck and is like the pintail; the long tail duck has a long tail. The tail helps it swim through wetlands and lakes with their slender necks and long, pointed tails held high. Redheads may lay their eggs in other bird nests and This diving duck is appropriately named and easily identified by its bright red head and gray body. The diving duck goes underwater to find its food. Now here's a fact that I thought was cool: the common gold-eyed wings whistle when they fly through the air. The common gold eyed duck lives in trees.

What I learned about wetlands is that they have a lot of water. The water brings lots of animals to it. The water helps protect the ducks that live there from animals that could eat them. The trees give the ducks protection. A place to live in the trees or on the ground near the trees. The trees give them leaves and twigs that ducks use to make nests for eggs.

This conservation field trip taught us how ducks live and survive in different locations. Along with different types of habitats. My favorite was the wetland and the ducks that live there. There are wetlands around where we live so it was easier to understand this habitat and have a better understanding of what it looks like. Along with the animals in it. This is the station I found most interesting and important because they talked about saving some ducks from extinction and why wetlands are so important to different animals that live there.
