

Benjamin Franklin once said, "When the well is dry, we know the worth of water. This shows if we don't take care of our watersheds we might figure out what it's like not to have water.

This shows how we all live in a watershed. Secondly a watershed could be a pond a lake or even an ocean. Watershed are what most people get their water from. Without a watershed it would be very hard to get water. We need to keep these watersheds clean or else we could lose a significant amount of clean water. One way to keep watersheds clean is to recycle plastic and to pick it up if you see any lying around.

A second way to keep our watersheds clean is to build berms when doing construction or use fencing. One reason our water is being polluted is people just throw there trash on the floor, this trash ends up going to our watersheds. We used to think that the trash in our watersheds would diluted away, but we now know that this is not true. So we need to reduce reuse and recycle this will keep our watersheds clean. Keeping our watersheds clean will help more than us it will help all the animals in the area. Another way to keep our watersheds clean is to make a P.S.A or a public service announcement this can encourage people to keep our waters clean, but don't stop there if you go out of your way you can go out on boats and clean waters.

Lastly, I had a great time at the conservation field days I hope this essay makes people realize how we all live in a watershed, and that we need to keep them clean for everythings sake.
