

. Dairy Farms .

Name: Paige Lynn Hilton

Name of Teacher: Mrs. Stone

Name of School: Union Springs Middle School

Are cows really using human technology? And wait did you hear farmers are making insects farm for them? How strange! Me and all my classmates went to Conservation day field days. When I was there me and my classmates all went to different stations and learned about different topics. But the station topic I found most interesting was Station 7 : Patterson farms. The most important thing I learned at Conservation field days is what Patterson Farms do in a day.

I learned how the cows at Patterson Farms use modern day technology. Cows use technology so the farmers can easily see how healthy the cows are. Another reason cows use technology is so the farmers can track how much the cows are awake and active, how much the cow eats, and how much sleep the cows are getting. Farmers need to see all this so they can figure out if something is wrong with the cow then hopefully the farmers will do something about it. If they don't do anything about it the cow could be really unhealthy and could get very sick so the cow won't produce the right amount of milk. I thought this topic was good to know because when the lady at this station said they do this I thought it might be an interesting topic to write about.

Something important I learned at Conservation days is what the farmers and cows do all day at Patterson Farms. Me and my class learned how this farm tills in an odd and different way than most other farms. At Patterson Farms i have learned how they use worms to till the soil, tilling the soil makes the soil fertile so plants will grow better tilling with worms also saves a lot of time and money. since they don't use these big machines very often they will have money saved up so they can purchase other equipment for there farm.

I picked these two topics because I thought they were both fun and cool to learn about. Cows help the world by producing milk for humans to drink so we can drink the milk and stay hydrated. Also I thought that learning about the way farmers use worms to their advantage was really smart and interesting. Also it saves money, Because farmers are not using these big heavy duty tractors and equipment. I think it could also be good to use worms instead of tilling machines. It would also prevent farmers from polluting the air. People pollute the air every day and they don't even know it. You can prevent polluting by maybe walking to places if you live close enough.
